The Lemi Podo 5 patient chair is available in a choice of upholstery colours.

ANTIMICROBIAL TECHNOLOGY

The Nefos vinyl leather fabric is made through production processes involving an Antimicrobial Additive Technology. Studies show that fabrics treated with this technology are up to 99.9% resistant to harmful bacteria.

The exceptional result that derives from it is a sanitised fabric with a permanent effect, whose matrix guarantees safety from any contamination thanks to the antibacterial, anti-fungal and anti-mold effect, which protects the coating from fungal attacks that can cause damage or bad smells, for the entire products life cycle. The antimicrobial additive technology protects the fibres without changing their characteristics, thus preserving their freshness over time. A high level of hygiene is essential, that's why this kind of technology was chosen by Lemi for all its bed and chair lines. The peculiarity of these coatings has allowed Lemi to give further value to its products, since thanks to this technology, the cleaning phase of Nefos vinyl leather fabric does not require the use of sanitising products but requires the use of a soft cloth moistened and soapy, to be rinsed simply with clean water.

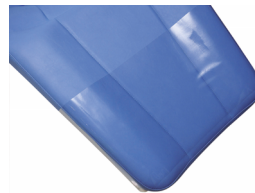

The graphic features three shield-shaped icons on a dark background. The first shield on the left contains the text 'UP TO 99.9% RESISTANT TO BACTERIA' and is surrounded by small white icons of bacteria. The middle shield is a diamond shape with the text 'SANITIZED FABRIC WITH PERMANENT EFFECT' and is surrounded by small white stars. The third shield on the right contains the text 'PERFECT CHOICE FOR HOSPITAL' and a white cross symbol. Below the shields, the text 'Antimicrobial technology / Tecnologia antimicrobica' is written in white.
